

Into to 3-D CAD with DesignSpark Mechanical

I am not going to show you “the way”, but rather a way.

The 30 second challenge.

Does everyone have a pencil or pen and a sheet of paper?

Design an L shaped bracket for an HSR04 ultrasonic sensor.

It must mount the sensor 2” above the robot deck and face forward.

The transmitter and receiver should fit through the mount.

The mount should have holes for screws in the 4 corners that match the holes in the sensor.

It should also have holes on the L part that touches the robot deck.

What does your design most closely resemble?

2d approach

3d approach

Your sketch provides some input into how you think.

This is also the first part of the process, an idea of what you want.

Design Tips:

Tip # 1

Start in 2D view. Make Use of Construction Lines.

Tip # 2

Never try to set dimensions with your mouse. Always use the dimension boxes.

Tip # 3

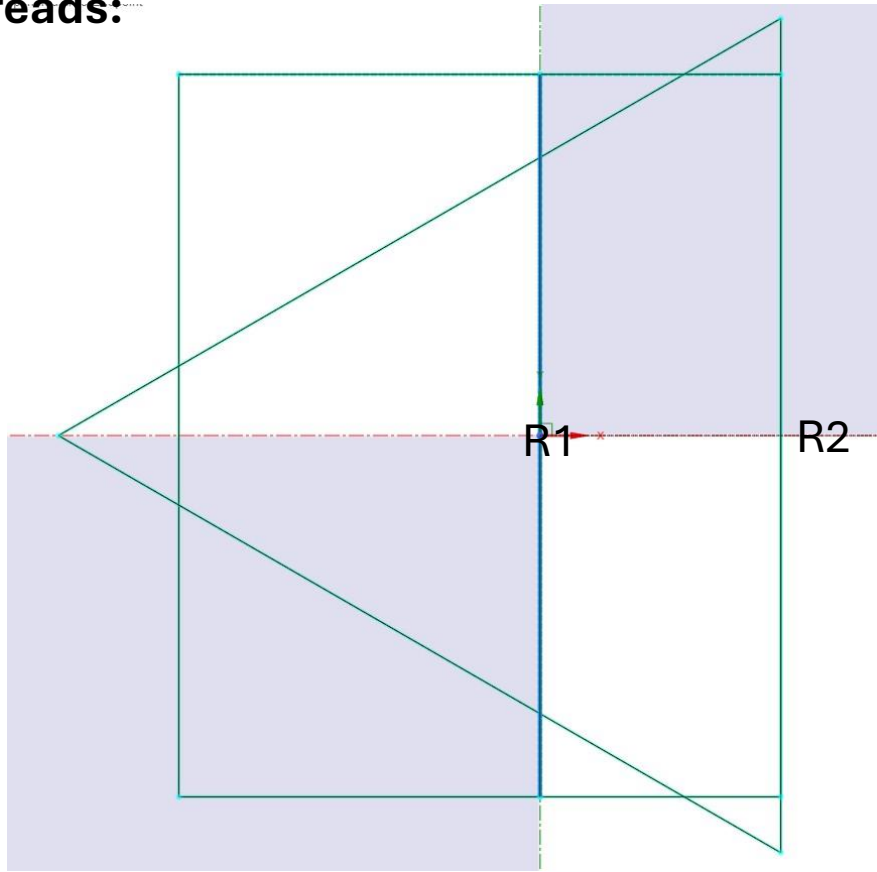

If you are going to 3D print the part, consider the strong and weak axis of the print.

Tip # 4

Don't limit yourself to 3d-prints Use the appropriate material.

- Use Al rods/shafts instead of 3-d printed cylinders.
- If the part is a simple plate, consider flat material (acrylic, plywood, Al).

Threads:

P = thread pitch

Cutter

M3x0.5mm

6-32 NC

R1

Height = P

.5

.79

Width = P x 0.5

5 x .5 = .25

.395

R2

Height = P

.5

.79

Width = P x 0.3333

.5 x 0.3333 = .1666

.79 x .1666 = .1316

Triangle

R2_width x 2

-.1666 x 2 = .3333

.13333 x 2 = 2.666

M3

2.5 - .35 = 2.15mm

6-32

2.705mm - .35 = 2.355mm

Bolt hole = tap drill size (mm) – printer determined tol.

Nut hole = tap drill size (mm) + printer determined tol.

2.5 + .25 = 2.75mm

2.705mm + .25 = 3.055mm

3D Printer considerations

There have been a lot of advancements in 3D printers over the 8 year since I bought my Malyan M150 printers in **2016**. Printers are now much easier for a beginner, and they are more reliable. They also print faster.

- Bed slinger design
- Direct drive extruder w/ single drive wheel.
- Dual circular rails for axis movement
- Dual steppers on z axis
- Small fan to cool filament as it leaves nozzle
- All steel construction (except addons)
- 200x200mm bed (about 8x8")
- Top mounted spool
- As configured can print only low temp filaments: PLA
- 1.75mm filament
- Martin software
- M3 extruder (similar to one on Ender 3)
- Magnetic bed plate
- microSD to SD card converter
- Cost \$125

Configured for Higher Temp filaments:

- Enclosure
- Different Bed surface
- All metal hot end

Modern 3D Printers:

Creality CR-10 SE
\$270

Creality K1C
\$450

Bambu A1
\$340/\$490

Bambu P1S
\$600/\$850

Cheapest Ok 3D Printer:

Creality Ender 3 V2
\$130
